

smartCrutch™

The smartCrutch™ is a solid combination of a passive support and active mobilization aid.

This function bar with forearm support, griff knob, angle adjustable support, height adjustable bar and a ball, is usable from the sickbed up to independent training in everyday life and in therapy.

For the users, this system provides an increased stability and mobilization security in safe mode. Especially in the postoperative phase, the smartCrutch™ is the first step towards "free mobility".

The system is the best way in fall prevention to create or recreate new free spaces when rising up and in the everyday life of people with handicaps for moving time in everyday life.

In conjunction with the single-board or the premiumgym function board, the system is the best possible vicinity for a safed therapy area.

With this mobilization aid, the therapist has a valuable working tool to mobilize patients in a targeted manner while the patient experiences a supported starting position in order to overcome fears in the initial movement.

The material and the range of application of therapy helps quickly and safely from the first step of therapy to "mobile freedom".
